

## To Dye For

Our story begins with a man named William Perkin, a test-tube, and a piece of silk.

When he was a teenager, William was just one of many who found chemistry and its potential for new discoveries an appealing vocation in the 1850s. Keep in mind that chemistry at that time, or alchemy, was just coming out of the dark ages.

But at the dawn of the industrial revolution, new ideas were emerging and those who sensed great changes on the horizon were looking for anything that might bring them fame and fortune. “Better living through chemistry” was the adage of the day. Let’s find out if they were right, and how it fits in with prophecy.

Perkin was one of the brighter young students at Britain’s Royal College for Chemistry and his professor was August von Hoffman. At this time, the British Empire was colonizing the far corners of the globe, and one of their more pressing issues was how to treat the soldiers who came down with malaria while serving the Empire.

The common treatment for it was quinine, found mainly in the bark of a certain tree, and quite expensive to produce. Many over the years had tried to synthesize it, but von Hoffman was convinced the answer could be found in coal-tar, a black sludge that was the by-product of burning and distilling coal into something called ‘gaslight’, which was transforming homes and businesses after dark in the 19<sup>th</sup> century.

Coal-tar was being investigated at the time for any and all possible uses, since there was so much of it. But von Hoffman was sure that one of its derivatives had a chemical formula that was very close to quinine. And yes, the hydroxy-chloro-quine that is considered controversial for Covid treatment is that very same valuable family of chemicals.

***Here is the world-changing part of the story:*** He never quite was able to reproduce the medicinal compound he was looking for. Instead, what was left behind in the test tube was a sludge of such striking purple color that he simply could not ignore it. Now, lab experiments with coal tar frequently produced colorful results that were generally ignored because they were not the intended result.

But for some reason he felt compelled to take a scrap of silk and stain it with this new purple compound.

Not only did it take to the material immediately, it remained colorfast, and it was beautiful. This was revolutionary for the times, and synthetics were born.

**Purple and scarlet, on silk** -- just what the royals of Europe and the Victorians were clamoring for. No more wearing nothing but black! The upholstery you sit on, the jeans you wear, the color of your house - all owe their color to William Perkin, who not surprisingly became a very wealthy man by the time he was 30, and is hailed as the father of the modern consumer society.

The Bible tells us that in the last days there will be a global economy, a consumer and trade-driven monstrosity made up of every product imaginable. And we certainly are in such a season in the world as our own nation has gone from a production style economy to a consumer driven economy. From an industrial revolution to a retail revolution. This commercial world was unthinkable before William Perkin. And if our story ended here, we might all just go home and appreciate our denim just a little bit more. But here in the last days, we know so much more.

Perkin's one big mistake was a case of loose lips combined with bad patent laws, and soon scientists from all over Europe were beginning their own experiments in breaking down coal tar, and the genie was out of the bottle. Germany in particular, was eager to have an identity on the world stage, and by 1876, the brand new nation-state of Germany had 17 synthetic dye companies. And the world would never be the same because of their global success. The top company? Friedrich Bayer & Co. who produced the world's number one scarlet dye.

But soon seeing that the field was becoming overly competitive, Bayer felt it was time to start making something other than dyes. You're already guessing where this is headed.

With a purely profit margin agenda, Bayer began to turn out a compound that would ultimately be called 'aspirin', and the multi-billion dollar pharmaceutical industry was born.

In 1901, Bayer came up with another health tonic, made from an opium derivative. Claiming it was the best cough medicine ever made, they called it "heroin" to reflect the heroic way it made one feel. It went for about \$5.00 per oz. On a similar note, Novartis Labs marketed LSD in 1938 to treat psychiatric patients. They admit they had no idea what it did.

And they sponsored pretty much most of the 1960s which simply proves that in the hands of sinful man, there is always the chance that things could take a turn from helpful to harmful, from beneficial to toxic. How many lives were ruined by this sort of wickedness? We will never know. But we're just getting warmed up.

By the start of World War 1, Germany employed tens of thousands in their chemical industry, and they controlled nearly 90 percent of global dye production and flooded the market with the latest pharmaceuticals, fertilizers and paints.

Fritz Haber, inventor of nitrogen fertilizer and poison pesticide gases (such as DDT), was asked to oversee the merging of industrial chemistry with military uses and at this point, it's impossible to overstate the wickedness that ensued.

German plants were reproducing chlorine gas to make dyes, and there was plenty to go around. Now, the Germans would do anything to come out on top militarily, so squads of men were specially trained, and soon arrived on the front lines in Belgium along with some 5000 canisters of chlorine gas; when the wind was right, the cylinders were opened and by nightfall over 5000 allied troops had died horrible, painful deaths. World War 1 has been historically referred to as the "chemists' war".

Bayer supplied Germans with pharmaceuticals, dyes, explosives, and poison gas. This is the very same Bayer that still makes many common pharmaceuticals today such as Cipro, Xarelto, Claritin, Alka-Seltzer, and Aleve. In 2016, Bayer bought out GMO giant Monsanto for 66 billion dollars. (When the truth came out about Monsanto, the highly carcinogenic Round Up, and its role in GMO food production, I would imagine it was suddenly time to rebrand the same mischief under a different name.) Bayer's profits average around \$20 billion per year.

Back to WW1: Germany has lost a war and is in desperate economic straits; they offered to share their fertilizers, dyes – and, in the midst of a global Spanish flu outbreak, 1918 - their aspirin, with the rest of the world. As a side note, history is finding out that unregulated aspirin dosages probably made that pandemic worse as people bled out and suffered all the toxic side effects that aspirin is now known for.

People probably thought, if some aspirin is good, a lot must be better. Endless lists of side effects were still far in the future. No one knew what aspirin would do - or what people will do when they are desperate. So again, how much devastation was wrought by the aspirin "miracle", we may never know.

So, making profits off of a pandemic and making health matters worse with synthetic chemicals isn't really new at all.

Germany soon believed that if they were going to develop and market new products, something a bit more radical still would have to take place: the chemical industry was then made up of numerous independent companies - but how about a powerful, financially massive merger to combine their unholy profits and production? Mergers of this magnitude are called "cartels".

By 1929, a massive chemical cartel came into being called IG Farben. It doubled in size by the start of WW2 because of Wall Street financial and American technical assistance, as they wheeled and dealt for a piece of the synthetics pie, pouring millions into these products.

Soon, there were over 2000 cartel agreements between Farben and foreign firms, including, Standard Oil, DuPont, Alcoa, Dow, GM, Kodak, Firestone, Goodyear, Glidden, Kelloggs, Monsanto, Nestle, Proctor and Gamble, and hundreds more. The companies Farben owned outright included: Bayer, Bristol Myers, Squibb and many more pharmaceutical and vitamin companies.

It would take an hour to list for you all the players, secret dummy corporations, and mergers that came as a result of the tentacles of IG Farben. But one thing is for certain: cartels are back – Big Food, Big Pharma, Big Agra, Big Medicine -- and so we are back to square one, and no one is ever going to put that toothpaste back into the tube as we barrel like a freight train toward the culmination of all things.

Now, along comes a young German politician whose one desire is to see Germany become great once again. Hitler knew that the only way to put Germany back on top was to have at his disposal the massive resources represented by the Farben cartel. Armaments, explosives, mustard gas, chlorine gas, aluminum, synthetic fuels and rubber - Hitler needed the IG, the IG needed Hitler. Farben officers became Nazi party members.

And the most horrifying aspect of the entire chain of events: the invention, production and distribution of Zyklon-B gas, used to kill the Jews, which was developed by pesticide king Fritz Haber, patented and licensed by Farben and sold by **Bayer**. In order to cement its global leadership with patented drugs, Farben tested their pharmaceutical substances on Jews in Auschwitz, Dachau and other camps. Enough Zyklon-B to kill 200 million humans was produced and sold. *That is the equivalent of the entire population of the US in 1970.* And the profits were mind-boggling.

Following the allied victory, the Nuremberg war crime tribunal commenced, and 24 managers and executives from Bayer and others were tried for crimes against humanity.

Those who were *really responsible* for 60 million deaths in WW2 were the Farben executives – and received the mildest verdicts. Assets of Farben went to the Rockefeller and JP Morgan trusts - giving them global control of the postwar oil and pharma industries, the biggest cartel ever.

Let's forward to the post-war generation:

## The polio vaccine

Americans were scared to death of polio back in the 1950s. The road to the polio vaccine is a fascinating subject and far too complex for our time here. But you might find one particular thread interesting in light of the subject matter:

Back in 1954, a brilliant virologist, Bernice Eddy, along with her equally brilliant partner Elizabeth Stewart, were the first researchers to isolate the first virus proven to cause cancer. That year, the National Institutes of Health (NIH) asked Dr. Eddy to direct the testing of the Salk polio vaccine on monkeys. There were 2 vaccines competing for the prize of being the “official” polio vaccine. Albert Sabin believed it should contain a live polio virus, but Jonas Salk believed it should contain a dead virus. Dr. Eddy made the discovery that somehow the Salk vaccine had been contaminated with live polio and the monkeys were becoming paralyzed as a result.

She warned the NIH that the vaccine was virulent, but her concerns fell on deaf ears and it was distributed by Cutter Labs in California. It resulted in the worst polio outbreak in history, infecting 200,000 people; 70,000 developed the full blown disease, 20,000 children paralyzed, and 10 dead.

In 1961, she also discovered that a cancer-causing monkey virus had contaminated 98 million Salk vaccines. Instead of rewarding her for her discovery, she was banned from her research and the information buried. She attempted to get the information out as an urgent threat to public health but was stonewalled at every turn, allowing Merck and Parke-Davis to continue to give this vaccine to millions of American adults and children. Perhaps their consciences eventually got the better of them because they stopped making the vaccines in mid 1961, but did not RECALL it. They were afraid of their reputations if anyone found out Americans were vaccinated with a cancer-producing virus. And dare I say, their profits.

So, between 1961 and 1963, millions of baby boomers were vaccinated with potential cancer, and since these vaccines change DNA, this virus is now part of the human genome and we know this because it has been passed on to subsequent generations:

One-fourth of healthy adults today have this virus in their system.

Six out of every 100 children born between 1980 and 1995 are infected.

It causes mesothelioma, bone cancers, and brain cancers, prostate cancers and lymphoma, all of which are up over 50% in baby boomers. They contaminated humanity, they knew it, and refused to admit it. And as you can imagine, Dr. Eddy was never allowed to speak publicly or do vaccine research ever again.

Today, Bayer who bought out Cutter Labs, is the largest pharma company in the world. Also out of Farben, speaking of judgment, came the RU486, abortion pill. It's not enough to kill the living, let's target those not even born yet!

Now since 2020, we have been grappling with an untested vaccine for a novel virus, and the threat of forcing this vaccine on every single person. Add to that the fear factor of losing all personal liberty unless one has the proper health papers. No wonder people are overloading on anxiety – and looking for more medication to soothe that problem, from the very same people who are already trying to destroy humans in multiple ways. And on and on it goes. Good thing cooler heads have been able to speak up and at least warn people about this scientific Trojan Horse.

This is what I know, and this is how I got there. Everything I have related here is easily verified and is a matter of history. Of course I don't want anyone to think I am saying they shouldn't take any meds or whatever they need to do regarding their family's health. That's personal. Don't let that be your takeaway today.

How about this: weapons of mass destruction like chlorine gas, *and* pain relievers like aspirin, and vaccine bio-weapons, come from the **same compounds**. The business of wounding and healing is a double-edged profit margin for this industry and the sheer knowledge of the scope of this \$500 billion a year business likely makes us *all* feel a little ill. Will this or that drug heal us or kill us? Alarmingly, a bit of both is my only conclusion.

So let's start to stitch this together.

Over 100 years after the global flu, here we had a so-called pandemic and what were they talking about? Quinine, vaccines, the nature of viruses. We are surrounded on all sides by "experts" who want us to hang on their every word, but we know Bill Gates' hands are bloody; his father was the national President of Planned Parenthood and Gates espouses eugenics to decrease the population of the earth. Fauci, he's complicit in the Wuhan lab experiments; he told a gathering of Columbia University Students in 2017 that there would be a pandemic during the "next" administration. All the network news is sponsored by, and the content approved by, pharmaceutical companies. If you are a sponsor, you approve of what is being said.

Revelation 18:11,12 start out like this: "And the merchants of the earth will weep and mourn over her, for no one buys their merchandise anymore: merchandise of gold and silver, precious stones and pearls, fine linen and **purple silk and scarlet.**" Now, I had read this verse many times, but the details didn't truly come to life for me until I dusted off a history file.

Revelation 18:23:

“For your merchants were the great men of the earth, for by your sorcery all the nations were deceived.’

*The word “sorcery” in the original language, is the Greek word, PHARMAKIA, it’s where we get our word PHARMACY, and the meaning is, “the administering of drugs or poison.” healing, and wounding.*

As I concluded my notes on this subject, I decided that maybe a better name for this rabbit hole would be, “Let’s See What THAT Does”, referring to the behavior of an industry that has from the beginning displayed a thorough disregard for life in favor of power and profits and making a name for themselves.

“Let’s light a match to coal sludge, I wonder what that will do?”

“Let’s push aspirin for a pandemic, and see what that does.”

“Heroin, and LSD, we have NO idea what that will do.”

“That gas, that poison, maybe we will win a war and do some ethnic cleansing too.”

170 years later and we have a “novel”, or “new” virus.

### ***What does it do?***

No one really knows definitively, which makes me continue to question the source of it as many of us have.

Why do I say that?

This person had Covid for 3 weeks, another had it for 3 hours.

That person ends up on a ventilator, that person had a mild cold.

This person had a stroke, a cardiac arrest - another loses their taste and smell for months on end – that’s neurological.

What kind of weird war was this? Not long after the pandemic they found that a certain genetic marker causes a person to have a stroke from Covid. What kind of pre-existing lottery is that?

“Let’s mandate masks, let’s lockdown - let’s see what that does.”

And a vaccine? What could possibly go wrong?

What does God do? Revelation 18. What a time to be alive, right?

Mary Danielsen
